Hi Yakir,

Thank you for your reply.

You can send SMS via Twilio in many ways. If you are sending messages your through our API Explorer you can just type the text as is and send.

Here is the sample that I tried in the API Explorer:

<p>ACCOUNT SID AC3ab0...4a46 - sannamalai@twilio.com's A...</p> <p>TO <input type="text"/></p> <p>Conditional</p> <p>FROM <input type="text"/></p> <p>MESSAGING SERVICE SID Select...</p> <p>BODY קוד האימות שלך הוא</p> <p>MEDIA URL <input type="text"/></p> <p>Optional</p> <p>STATUS CALLBACK <input type="text"/></p>	<p><b>Request</b></p> <p><input type="checkbox"/> Show your Auth Token <a href="#">Check out the curl manpage</a></p> <pre>curl 'https://api.twilio.com/2010-04-01/Accounts/AC3ab0dfb443fc14094192b19fbf324a46/messages' \ --data-urlencode 'to=0123456789' \ --data-urlencode 'from=AC3ab0dfb443fc14094192b19fbf324a46' \ --data-urlencode 'body=קוד האימות שלך הוא' \ -u AC3ab0dfb443fc14094192b19fbf324a46:[AuthToken]</pre> <p><b>Response</b></p> <p>201 - CREATED - The request was successful. We created a new resource and the response body contains the representation.</p> <pre>{   "sid": "SM4aba5000ee494b01bca997c11434cf62",   "date_created": "Sun, 28 Jul 2019 13:48:12 +0000",   "date_updated": "Sun, 28 Jul 2019 13:48:12 +0000",   "date_sent": null,   "account_sid": "AC3ab0dfb443fc14094192b19fbf324a46",   "to": "0123456789",   "from": "AC3ab0dfb443fc14094192b19fbf324a46",   "messaging_service_sid": null,</pre>
--	---

If you are sending messages like this, you can try this in this URL :

<https://www.twilio.com/console/runtime/api-explorer/sms/messages/create>

On the left-hand side you will need to choose your number you are sending the SMS from, then you will need to enter the number you are sending the SMS to and also text for the body of the message. All other fields can be left blank and you can hit the red 'Submit' button at the end (you may need to scroll down within the box on the

left-hand side). After you hit the submit button on the right-hand side of the screen you will see sections titled Request and Response.

If you are programmatically sending SMS, depending on the programming language, you can type the text in the language you want under the body parameter. Here is the reference article for you: <https://www.twilio.com/docs/sms/tutorials/how-to-send-sms-messages-php>

I have also included a screenshot of the code as a reference for you. Note that below code is in PHP:

```
$message = $twilio->messages
    ->create("+15558675310", // to
        array(
            "body" => "אוה כלש תומיאה דוק",
            "from" => "+15017122661"
        )
    );
```

I hope this helps. Let me know if you have any questions regarding this. Thank you!

Regards,

Sara Annamalai
